

## DebLew

I have a blood clotting disorder and I've had nine DVT blood clots in my lifetime since I was 15 years old. Every time I have a DVT blood clot I know what I have. I feel it I've had them before when I've gone to the doctor, they dismissed me. They do not want to do Dopplers. I have to argue with them because I'm usually asymptomatic, except for the pain every single time all times I've had doctors dismiss me and I come back a week later in agony and they finally agreed to letting me get the Doppler and they said oh my goodness you have a blood clot and I'm like yeah I told you you don't listen to your patience I've had to fire multiple doctors who refused to listen to me and I have an attitude towards them and I let them know right upfront that I've had many missed diagnosis and that I need a doctor who's going to partner with me and listen to me not one who's going to dismiss me.

I've even said to them when I've had the blood clot I said do I need to get ugly with you to tell you and demand that you do a Doppler scan on my leg?? I have never seen such apathetic coldhearted medical professionals in my life I'm not asking for somebody to give me a hug cause I'm a big crybaby but I have a serious medical issue And I am sick and tired of these physicians and nurses who are just plain coldhearted, and they do not care whether you live or die

## Guillermou

The reality today is that allopathic medicine is only interested in money and the power to control the destiny of our health. The classic objectives of professional performance have been reoriented towards a cost-benefit relationship, even if this means sacrificing the human quality of care. The story centers on The Rockefellers and the Carnegie Foundation pumping hundreds of millions of dollars into medical schools that were teaching intensive drug medicine. without any emphasis on natural medicine. This is how alternative medicines were mistreated and modern doctors were created without knowledge of nutrition, detoxification, well-being or disease prevention.

The relationship between doctors and the pharmaceutical industry has become more intertwined and intertwined than ever. Many physicians attend dinners to hear a "hired" expert speak about a product, take educational trips to seasonal venues or medical conferences, or receive funding in the form of research grants, training support, or consulting fees. It is evident that this influence is corrosive to the patient's health. The Scientific-Technical Revolution has caused the appearance of new technologies, however, a fragmentation, depersonalization and dehumanization of medical care is observed. The multiple causes that are causing illness and death due to medical treatment are caused by not caring for patients according to a holistic vision of the patient and the causes of the illness, considering the unity: mind, body and spirit.

Western Medicine acts through medical specialties, however, holistic therapy each person needs individualized treatment with a focus on the patient's vital forces, the human being has a great potential for self-healing. The power: acting in a comprehensive manner with diet, light and other energies is the power to heal, starting a process of change, which allows you to improve aspects of your life so as not to get sick again.

## Guillermou

An important indicator of patient safety is the rate of medical errors that occur in hospitals. The undesirable effects derived from the provision of health care are, in many cases, the cause of illness, trauma or death. Medical errors in health care can cause illness, injury, disability and even death, and occur in one in 10 hospitalized patients, some can be prevented as reported by Dr. Mercola. Medical professionals have been losing the humanistic attitude and commitment that for centuries constituted a hallmark of the Hippocratic model. Doctors abandoned the human sensitivity of traditional medicine to adhere to the prevailing rational-scientific model and cutting-edge technologies, which have turned health into an expensive, impersonal and susceptible to commercialization product.

Based on tests, often unnecessary, and that completely nullify physical contact, a form of non-verbal language loaded with symbolism and that depersonalize medical practice. Desiring economic and professional recognition, doctors abandon their humanistic essence to enhance their professional identity. Humanity must regain the path of health with natural strategies with the control of the variables associated with lifestyle, with the control of epigenetics.

Vaccines, medications, fluoridated water, sedentary life, junk food, pesticides, tobacco, EFM, etc., the lack of essential substances and an insufficient detoxifying function, cause mutations in our DNA and aberrant methylations, which favor degenerative diseases. Natural medicine is the path to health, it is possible to control the epigenome with lifestyle, with healthy eating (nutrigenomics). The marginal and exclusive conception of Allopathic Medicine is not the solution.

Hey Professor Gui, medical mistakes once the third leading cause of death, now A # 1. A status not likely to be lost for anytime soon even if the C-19 were to be properly addressed. (The after effects residue most likely to leave scars for generations.) To speak such unspeakable things years ago was to endure excommunication from the Predator\$ Machine. Ask Doc. Ask RFKJR. Now even if you are just John Q. Public and asks simple questions about such things one runs the risk of being labeled Conspiracy Theorist, misinformation, disinformation, Mal-information peddler. Mal-information peddler, my favorite, it's true but we don't want people to hear it. It's inconvenient and messy to cure the real Dis-ease, Corruption at nearly level we could think of. It all has the stink of Globalist depopulation agenda previously kept running under the radar.

Most medical mistakes and errors are ignored at best, dismissed, or hidden in many cases. Modern medicine is the single profession where mistakes are routinely hurried (figuratively and literally) and where investigation into medical mistakes only occurs in legal battles. In normal, healthy professions, finding mistakes leads to competition and improvement. Not so in modern medicine.

## Guillermou

Thank you Just and Tracy for your valuable contributions. Humanity must regain the path of health with natural strategies with the control of the variables associated with lifestyle, with the control of epigenetics. Vaccines, medications, fluoridated water, sedentary life, junk food, pesticides, tobacco, EFM, etc., the lack of essential substances and an insufficient detoxifying function, causes mutations in our DNA and aberrant methylations, which favor degenerative diseases We need to control epigenetics, that is, the interaction of our wonderful and ancient genetic inheritance with the cellular micro and macroenvironment and the influence of this environment on the expression of genes and diseases, demonstrating the enormous power that our diet has on our health (nutrigenomics).

. Genes do not determine diseases, but epigenetics that influences our lives, which determines the transformation of the stem cell into "malignant". By modifying our lifestyle we can return to a situation of biochemical "normality." The current behavior of humanity has nothing to do with our origins, modifying the biological laws that made life possible. We need air, water, sun and substances from the earth through raw foods: salads, lectin-free vegetable smoothies, fish, ...and healthy fats recommended by Dr. Mercola.

The mind, which is the metabolic regulator of all organic processes and has the ability to compensate for imbalances. A long-lasting worrying thought can be the origin of an illness. The immune system has two main functions: fighting infectious agents and causing inflammation. Inflammation is the result of overexcitation, due to negative epigenetic factors, damaging the tissue and over time producing a series of diseases. Chronic stress reduces eudaimonic happiness, while activities such as meditation protect DNA. Mental discipline is capable of affecting genetic expression and regulating the function of our DNA

## pecanroll

A family member was misdiagnosed as having a pituitary tumor. What they had was neurocysticercosis. People have parasites being called tumors and psychoses when poisoned from mercury or gadolinium.

## wareagle82

While the demographic numbers are interesting, the mainstream press would fixate on the disparity rather than the problem of misdiagnoses itself. The remedy would be more anti-bias training and the like, which would do absolutely nothing to solve the issue, which is the point of activism. Maybe there are specific reasons why the problem is worse in some groups than others and potential remedies can be found, but it also distracts from the underlying issue that something is going wrong in hospitals and clinics, and identity gaps are not it.

## DrLizbeth

Medical care is a "partnership." Unfortunately there are way too many patients and/or their relatives who can't give a history to save their own lives or that of their loved ones. People think that a consulting doctor knows everything about them because they already gave their history to their primary care doctor or to an ER doctor. Literally no patient takes any responsibility for organizing their own prior medical history, test results, specialist reports. Rule #1: Collect all your test results and acquire CD discs of any imaging that is pertinent, esp.

if the doctor has no access to those reports or images. As long as you are conscious and coherent, you are the best advocate for your medical care. If in dire straights, have a flash drive summarizing your medical info with you. I even do spread sheets of my pertinent lab/test results and add comments of relevant clinical events. Spend time with the doctor to answer his/her questions rather than have them waste time "looking up" prior information. Don't tell the doctor your diagnosis unless you are a doctor; their job is to figure it out based on the info you supply.

You can say things like....."It FEELS LIKE I fractured my pelvis after a minor fall." That was me. It turned out I had stress insufficiency fractures due to osteoporosis but didn't have that documented per last DEXA scan but I had osteopenia. Xrays were negative acutely. Misdiagnosed as back pain due to degenerative spine disease. It was a CT and then MRI that eventually diagnosed bilateral acute sacral fractures.

## **rmbittersweet**

What western doctor lets you spend time. I have been to many doctors who have all the pertinent info organized by their own staff that I gave them months before appt and still have the care provider tell me they didn't have time to review any of my information and I have to give them a run down of the info and all the time for the appt was just wasted. They leave tell me the CNA will be in with next step only to find they ordered a test I already told the results of and are in my chart. They system is broken...they only thing that matters is money.

All of our systems are collapsing or being co-opted. Not only medical, but also educational, economic, justice, food, media/communication, etc. If you listen to the news, all you hear is LIES. This is a time when we desperately need statesmen to lead the people in the direction they want to go, anyway. Good leadership is not about mandates and coercion. Yet, we get sell-out politicians more interested in feathering their own nests and enlarging their own fiefdoms. Somehow, not understanding that they are only useful idiots. There is so much ignorance of science and denial of reality among leaders. Sadly, they are representative of the broader population, in that, most hide behind some panel of "experts" and lack the confidence to stand up for what is right and speak truth--just more copycat "gravitas" and speaking from a script.

(Just because the experts do not know does not mean no one knows.) Sheeple will go along to get along, somehow believing it will keep them safe and they will be taken care of if they do not rock the boat. When did the blood run so thin that so many people lost or sacrificed their integrity and allowed themselves to become extremely dependent? Sold their birthright for a mess of potage? LIES, LIES, LIES. It is sickening to listen to repeatedly being told what we know is not and cannot be true.

HOW CAN WE TRUST MEDICAL PRACTITIONERS WHO INCREASINGLY EITHER WORK FOR THE STATE OR HMOs? Knowing they have been given a checklist of items to cover within a short period of time, without enough time left to address the concerns you made the appointment for? Yes, many of us have received "the talk" about getting jabbed so they can meet their quotas and get their bonuses--and the institution then becomes eligible for federal funding. <=Only one example. A few years ago, I saw a doctor for a rash on my ankles that I suspected was an allergy to some plant. I refused numerous x-rays--they told me x-rays were standard \$procedure\$ for all leg complaints.

-continued- Do not make the mistake of depending on people who are not dependable and for whom your well-being is not their highest priority. If you are a reasonably bright individual with good problem-solving ability, you can figure many things out if it is not an immediate life-threatening situation. There is so much research available (that doctors never read) and many different protocols for solving a problem, not just one way. Once a doctor told me I would probably die anyway. I walked out of his office, did my own homework and became my own guinea pig, because I realized I could do no worse on my own and would do a lot better by suffering less of his standard treatments.

i still believe that healing is the natural order of things and, that, if, you support the body and give it what it needs, recovery is possible. I studied like my life depended on it, which was much more productive than his 15-minute doctor appointments, miserable lab tests and drugs. I questioned everything and made sure everything that was standard medicine could be based on a solid foundation of proven knowledge. If not, I discarded it and started over. I also understood that much medical research is written at an 8th grade level. All it takes to decipher the unfamiliar vocabulary is a medical dictionary and some time--or a good understanding of Latin.

Some chemistry may be helpful. I had an opportunity to register for a human dissection seminar and highly encourage it for anyone with a strong stomach (the odor of formaldehyde). It was extremely educational and fascinating to see how the body works. I had an excellent instructor. You may (?) not need a lot of pre-med requirements for seminars like this although an understanding of anatomy and physiology would be helpful. I don't think anyone ever checked to see whether I had taken any pre-med classes as long as I paid my fees. I found A&P to be mostly memorizing Latin names along with locations in the body and functions.

I recently got off an SSRI inhibitor drug for panic disorder. I was on it for five years. I had to gradually taper off it. I decided I didn't want to be on any drug that alters the mind in any way. I just carry an emergency low dose Xanax with me. Only had to use one in five years. I feel better off the drug. It was an old school drug, fluvoxamine . These drugs are hard to get off. They don't tell you that when you start them.

A hospital I used to visit had a certificate on the wall proudly proclaiming only 537 people died under their care last year. They were proud because their "goal" was for 560 people to die.

Hey, it's ok. People are simply PRACTICING medicine. Maybe they'll get it correct on the next victim.
