

Guillermou

In a review published December 26, 2023 in Vaccine, researchers found that non-live vaccines such as influenza, COVID-19, hepatitis B, and diphtheria, tetanus, and pertussis (DTaP) tend to cause side effects. non-specific adverse events (ENE). , increasing a person's risks of all-cause mortality and infections from other diseases. The Vaccine study highlighted the DTaP, influenza, malaria, hepatitis B, and COVID-19 mRNA vaccines. www.theepochtimes.com/health/vaccines-can-impact-long-term-survival-fr.. 2024-01-

10&utm_medium=email&est=iysFLKH0W4cV%2FwP14cFVoL1Ael0bVYrqT%2Fe%2BxW3rNAULTuw%2B%2BUwrbP3f3PeQV1rc (01/18/2024) .----- In an interview with Action Canada's Tanya Gaw, McCullough discussed the risks that people "vaccinated" against Covid pose to those "unvaccinated." Simply put, she compared the situation to non-smokers inhaling secondhand smoke from smokers.

Another recently published study found that mRNA remains in the lymph nodes of those pricked for months, further supporting McCullough's claims. There is also another recent medical study that McCullough called the "most disturbing" that shows that mRNA poisons can be transferred from breast milk to babies. Early in the "pandemic," McCullough advised that the unvaccinated should wait at least a month before coming into close contact with someone who received the Fauci flu vaccine. He has now increased it to 90 days or more. rairfoundation.com/dr-peter-mccullough-warns-covid-vaccinated-people-a.. (2022) www.tmrjournals.com/public/articlePDF/20221114/483e983160eb24f1ef94bdd.. I am unvaccinated and never got Covid, but I live in a nearly 100% vaccinated state of Australia. I developed a protocol that works for me, including a daily regimen of drinking and irrigating my nasal passages with ozonated water and taking lysine and vitamin C. On one occasion, I was at the local laundromat. A man arrived while I was attending to one of the machines. He sat down in front of my laptop, which now that I think of it was rather odd. Anyway, we got to talking about Covid and the vaccine.

He said he had to take the vaccine to visit his mother at an elder care facility. I told him about ozone and asked him to pass over my laptop so I could find a machine on eBay to show him. As he passed it to me, his hand touched mine. In a perfect world, it might have been romantic, but not in this one. I left the laundromat thinking nothing more of it. That night, as I drifted off to sleep, suddenly a chill came over me and my body began to shake as if I was stranded in the snow in Antarctica, and I started to feel the onset of flu-like symptoms.

Normally, I irrigate and drink ozonated water after I have been around others, and if I go shopping, I spray everything I buy with it as well. However, on this occasion, I had relaxed my protocol and forgot to do so, since the pandemic had been over for some time, and I wasn't worried about spike protein shedding because I was new in town and didn't socialise. Instinctively, I grabbed a handful of chewable vitamin C and lysine tablets and washed them down with several glasses of ozonated water and irrigated my nasal passages as best as I could.

Amazingly, the symptoms eased almost immediately, and around an hour later, I felt fine. I hope my experience will help in your research, doctor. I'm confident my protocol will address any spike proteins I may encounter among the 99.5% vaccinated populace. Since I started it, I've been sick only once. (I hadn't realised that my ozone machine had stopped working and I needed a new one!)

tru 39098 - maybe that is what the government "says" for certain reasons of theirs - but certainly not what is the truth. Generally, people considering around 65-75 % vaccination which is more than bad enough. Especially as the constantly importing Indian migrants - of half a million just in 2023 - has not got the vax.... Before you translate for something else, I mean the original population - especially the Indigenous one which were force vaccinated - will expire - then the imported ones which are more pliable...will inherit the Earth....

My extended family is unvaxed but I have realized that I can tell when I have been around vaxed individuals as I develop a cough and a metallic taste in my mouth. A dose of ivermectin quickly stops it. I also believe there is "secondary shedding" as I now get this same cough and metallic taste when around my unvaxed granddaughters. Their mother, my daughter, says they smell metallic to her. We are trying to detox them but it is an ongoing process as they are exposed at school and through friends everyday. It is such a shame that all we went through to stay unvaxed has been negated by the vaxed. The evil powers have figured out a way to get us all by making the vaccine more contagious than the virus. They want us dead. Do not comply!

I can only report what we have experienced with our nearest and dearest: both middle aged parents in one family with sudden onset cancers; one elderly member with early dementia, toddlers with severe behavioural problems; kindergartens where infectious RSV are rife. Other hidden epidemics in that age group have included bronchiolitis; a never ending series of chest colds; mouth, hand and foot infection a nasty one causing blisters and difficulty swallowing. Perhaps it was always this way but then we didn't have mobile phones, 4G, 5G and the emf soup that our children brains swim in from the moment of conception. drtenpenny.substack.com/p/rsv-revisited-and-updated?publication Perhaps we simply do not yet know what was really involved in the fake plandemic and fake "vaccines" aka bioweapons.

What we do know with certainty is that there is a conspiracy to depopulate and disable the human species on planet earth by multiple strategies. Everything should be viewed from the stand point of that goal. We can deduce that there are no limits to the crimes against humanity that may have been planned by the narcissists, psychopaths at globalist HQ. The latest theory of harm from the bioweapon suggests mental health problems as well as physical manifestations particularly "turbo-cancers" and speeding up of existing nascent diseases such as cognitive impairment. I am not vaxed but my husband got three jabs between May and December 2021. We are in our late 60s. He doesn't have any obvious injury from it but conditions he had previously have gotten worse. I have developed breast cancer, triple negative, which is good. During the biopsy I felt a lot of pain which the doctor said was essentially psychosomatic, that the bursts of pain were occurring when he wasn't touching me. I have never been accused of anything delusional before. After the biopsy the lump felt 2-3 times larger than before.

I decided to switch to a different doctor. The lumpectomy took longer than expected because the surgeon found the lump to be much larger than shown on mamography and ultrasound. Biopsy after surgery showed margins were not clear so I am having another surgery this coming week. Our dog, who adored my husband died of cancer last weekend. I am wondering how much the exposure to my vaxed husband could have affected me and our dog. I am also wondering about what caused the lump to grow so much after the strange experience with the biopsy.

Vaccines affect people in different ways. Those that have unpleasant reactions and go to bed for a week are actually lucky because their body is telling them immediately that the vaccine is dangerous for them. If they fail to heed the warning, they are more likely to come down with cancer as a dear friend did. She dutifully got the initial two shots, and after each one she went to bed the first time for a week, and the second time for two weeks. Then she began getting the boosters, and that sent her to bed for three weeks, four weeks, and longer each time.

Then about 6 months ago she was diagnosed with ovarian cancer and died within a month. Cancer has increased a lot since Covid came out, and it is killing people quickly after the diagnosis. Those who get the vaccine and seem to handle it well are the unlucky ones because they think all is well. Their cases will not affect them really badly until years later when they reach their 60's or older and then they will come down with cancer or Alzheimer's because the Spike Protein will have all those years to percolate in their bodies until they eventually die of their condition.

That is why getting sick soon after the initial shot, if they will heed the warning, could save their life, especially if they will use one of the effective detoxes that helps to rid their body of the vaccine including the Spike protein. I hear that many of those vaccinated in the last three years aren't continuing with the reformatted Covid shots because they finally understand they won't protect them, and in fact may be responsible for long Covid.

caws

Question: How has Dr Hazan identified Covid 19 specifically [and not just a regular corona/flu virus] when no lab worldwide has ever been able to obtain a viable sample to study? We know PCR can't differentiate between Covid and a cold. Also why the surprise on shedding? Ralph Baric [Fauci's minion scientist with many patents on corona viruses and ways to enhance them] also designed a way to promote shedding did he not? All live virus vaccines ;especially the nasal ones, have always shed; polio, MMR, chickenpox, flu. This corona virus shot is more insidious because it is not supposed to have the virus in it only GM spike proteins in lipid nanoparticles etc ;yet at least 6 countries have found the DNA of SV40 [cancer causing monkey virus from 1950's polio vaccines] in Covid shots? How can that be unless it was put there on purpose? Could it be the reason for the turbo cancers that do not respond to chemo; because SV40 is known to be extremely resistant to treatment?

Posted On 02/03/2024

Macskak

Caws Excellent. The best definition I found till today is from a book of an Alzheimer's researcher saying: "The PCR is practically a photocopier of the DNA" - for laboratory research purposes - when there is too little DNA obtainable to do proper research with it (for example from cerebro-spinal fluid).

Many thanks to A Midwestern Doctor for posting these excellent articles (and all the others) on Mercola.com. Nearly two years ago, I developed a bad rash on my forehead and nose, which seemed to flare up for no reason, then would die away over a few days. I thought I must have become allergic to something, so I stopped using the shampoo that I had used for years, substituting it with liquid soap. The rash still appeared sporadically, so I did some research, and decided I could be deficient in copper. I bought a supplement, but this didn't make any difference. In the meantime, I had also stopped using shop-bought soap, and had begun making my own coconut oil soap, with no improvement.

In the summer of 2022 we had a holiday in the Lake District and, after a few days, my partner remarked how good my skin looked. I wondered if it could be the local water, but at home I have a reverse osmosis filter, so I ruled that out (at the time, I had been structuring my drinking water, and even wondered if it was the higher pH of this that was causing the problem). Last week, the rash flared up badly again, then a few days later I read AMD's previous article on this subject. A big light bulb came on when he explained that shedding can cause a rash, and I set to thinking about whom I had come into contact with (Although I remain 'test' and jab-free, my partner had three jabs, but I have never felt ill, or developed a rash in her presence).

It occurred to me that I had taken in a parcel for my next-door neighbour around the time that the rash reappeared. He is type-1 diabetic, and I believe he has had 'the jabs', as in my experience, people who consider themselves 'vulnerable' have had them all. When I realised from the article that it was a shedding injury, I took Ivermectin for 3 days. The rash has subsided, and I will now be monitoring it, and any contact with my neighbour, whom I try to avoid anyway.

How easy, or hard, was it to get an ivermectin prescription? Where are you from please?

Posted On 02/03/2024

Macskak

Stickybud I do not socialize since the lock-downs - which is in my unvaxed case was half a year - I go to shop for food once a week. I live exactly between two 5G towers - my mobile/laptop are 4G. Next to my eyes & on my nose there are constantly eczema patches - sometimes they go away if I take prednisolone - but I do not want to be on such medication - so I just live with it. That is life - now.

Posted On 02/04/2024

Now you have me thinking. Not jabbed but had covid in August 2021. I go to AZ for the winter. At the end of January every year since I develop a rash and/or itching only on my hands. We have ruled out foods, soaps, chlorine. I'm wondering if it's because I'm in a highly vaxxed area. But then it doesn't return in the fall for my short trip. Have it right now and has been less irritating this year.

Posted On 02/04/2024

stickybud

GoldCoaster, sorry about my late reply - hope you see it before the article goes down (or maybe you subscribe to Dr M's substack?). I am in UK, but bought the Ivermectin from India in August '21, as my partner had had the jabs, and I was hoping she would take it to rid the spikes from her body, or if she caught 'covid'. (She wouldn't take any, but at least now realises that something wasn't quite right with what went on 4 years ago, and since, and acknowledges that 100,000 excess deaths have occurred here in the past two years.

I also believe that she received placebos, as she is a cancer survivor, and hasn't suffered any relapses or other health problems, thank God). If you go to IndiaMart - <https://www.indiamart.com/> - you will find many suppliers who will ship abroad. It was a bit of a palaver, but my order of 200 tablets cost 30 pounds [funny, the pound symbol doesn't come up] (they cost pennies in India!). You will have to sign up to an international money transfer company - it turned out that the first one I registered with would only process payments from a company, rather than an individual (I think it was Western Union) - but I then signed up to Wise, and the transaction went through OK.

I was worried that my order might be confiscated by 'the authorities', but it arrived in about two weeks, securely packaged, and marked on the customs label merely as 'medicines'. I'm looking at the label now, and if it's any help to you, the vendor was 'Sea Pacific Exports Pvt Ltd'.

The expiry date on them is March '23, but I realise that there is a big margin on these dates and, as they have been in my fridge, wrapped in black plastic all this time, I felt confident that they wouldn't do me any harm. I don't seem to have incurred any, from those three I took! Would love to know how you go on, should you try to order any (I believe you're in Oz, so the buggers at your customs might be more vigilant?) - you could make me a friend, or something. Good luck, Phil

Posted On 02/04/2024

stickybud

Macskak, you must be aware that Dr M has published several articles on the dangers of EMFs. Earlier today I searched 'black streams', as I know somebody who is experiencing some disturbing phenomena in a place she has moved to, and this was a vague memory that I thought might be relevant. I came across this article - www.blushield-us.com/blogs/education/health-effects-of-geopathic-stres.. - which I found to be very interesting. This company sells devices (quite expensive) which they claim emit frequencies conducive to bodily homeostasis, and will exclude detrimental exterior ones. I didn't look too closely at the individual devices, but there are some pretty compelling testimonials on the site. If you can afford one, it could be worth trying.

I have never had any strain of flu, including Covid or Sars that I've been exposed to in their pandemics in the U.S. throughout my life. I have also never been vaccinated more than three times in my early life because of the highly violatal reactions I suffered including asthma. I haven't suffered any shedding from any of my vaccinated friends I am around in my church choir I sing with. I suspect that if a person stays unvaccinated by any vaccine they aren't as likely to be affected by shedding.

Posted On 02/03/2024

GoldCoaster

Interesting thoughts. I'm not aware of suffering shedding either. Never had a flu vax and the most recent shot was in the 1990s when I had a tetanus shot before I was vaccine aware. Growing up, flu shots were only given to the elderly. I had about 5 shots as a child in the 1960s. I contracted measles, mumps and chicken pox, so developed natural immunity to those diseases.

WHAT CAN YOU DO? My 51 year marital family is jabbed three times even after I told my wife and son everything known in 2020 (Senneth, Mercola). My 8y/o grandson jabbed at least twice. I am unvaccinated. When my wife and I visit, we stay at their house. I sleep on the sofa. I have used my Nebulizer (makes a fine mist) of H2O2 (food grade hydrogen peroxide at 00.0125% concentration diluted with Normal Saline {made from 9.5% Rock Salt ONLY {not table salt} in distilled water). I cut 0.03% H2O2 in half to (0.150% with Normal Saline (equal amounts of both). I have 7 different ways I inhale to ensure coverage everywhere; with nose I sniff hard and snort to reach tonsils; with lungs I stand and reach high to ensure "deep lung" reach verses shallow breathing.

If mild symptoms five-minutes; if strong symptoms, 12 minutes. Afterwards I am fine all the rest of our stay and the 10-hour drive home. I have had two years of 1/2 week "less than well" and 1/2 week "well enough"--it coincides with my wife's 1/2 week away at work, and half-week home. Now my wife is home 6 days a week, and I use my nebulizer a bit more often. New readers may not know that Mercola, and Schallenberger recommend hydrogen peroxide therapy for C19 symptoms; as does Cardiologist Dr. Thomas E Levy, MD/JD=attorney who wrote Rapid Virus Recovery on Amazon—great book at explaining and citing references (you'd expect that from an attorney); many other books also @ Medfox.

I take everything other readers take except ivermectin (though now I have some) and Methelyne blue that I haven't got yet. I probably take more antioxidants than most; and I eat Merc's Vita-C like candy when I am sick 10-12 a day and with Nebulizing (read Rapid Virus Recovery to understand Fenton Reaction in body, how body kills off infection materials).

Posted On 02/03/2024

I consider myself vaccine harmed or damaged as a result of getting 21 shots shoved into six needles in one hour, pre-deployment to Desert Storm combat in 1990-91. I think this because of an article AMIDWESTDOCTOR wrote about vaccine injuries when he mentioned what he considered as the three worst vaccines ever: Anthrax and Small Pox (that I got) and Gardasil. Also overseas we were ordered to take a "nerve synapse blocker" pill (I don't recall the name). It was supposed to prevent (or slow) deadly Sarin Gas, a nerve agent, from killing those of us in the thick of battle. It is a shame to not get info on matters like this until about 33 years later. But i've done well; but I am very susceptible to vaccine shedding (but only with mild symptoms because of the vita-nutrients-H2O2 that I take.

Posted On 02/03/2024

GoldCoaster

This is truly shocking. I found myself mesmerized reading this and no other article on Mercola has had that effect on me, especially what others have picked up on, being around vaxxed people, and almost esoteric in some of the descriptions. I have not felt any reactions or smell being around vaccinated people, or even a just vaccinated man, (who had only just returned from the clinic) I was working with. I feel lucky, as vaxxed people are everywhere. I think there's dating sites for unvaccinated people. If ever I find myself single, I won't go anywhere near a person with spike protein in their breath and body fluids!

On Dec. 20, 2023 I had a heavy nosebleed which I attributed to working with some strong glue and went on with my life. Since then I had 2 more minor nosebleeds, one 12/24, 2023 & another 1/12/24. On the 19th of Dec. I had attended a packed city hall meeting and because there were so many in attendance stayed in the hallway with a group. Chances are excellent my nosebleed was from shedding. I have had covid twice and did not take the covid shots. My reaction could have been caused by those at the meeting who got the boosters.

My wife and I are unjabbed; my wife took cruise ship passengers on tours when their ships were in port. Most or all cruise ship passengers are jabbed. Over the past two summer (S hemisphere) seasons she has increasingly complained of tiredness but otherwise has been apparently healthy until two months ago, when she complained of a pain in the left side of her abdomen. The GP diagnosed diverticulitis, but it became worse so she visited the ED, had a CT scan and was diagnosed with cancer in her kidneys, liver, ovaries, lymph nodes and lungs. It was untreatable and she died two weeks ago.

I questioned the mortician who embalmed her, asking about any irregularities in her blood, e.g. clotting of any type, and he assured me there were none, it was perfectly fluid and normal, which tends to rule out that factor of the vax. It seems to be more than coincidental that a person, who was chemically sensitive to preservatives and an asthmatic, should contract what can only be called a turbo cancer, similar to jabbed people, after mixing with groups of jabbed people in the confines of a minibus, and die from that disease within 2 weeks of diagnosis.

RE: "...the vaccine manufacturing process can cause the vaccine to accumulate in the lungs" I presume also the shedding. There has been an upsurge in cases of bronchitis across much of the country. This is what I am observing. Many of my neighbors are sick with bronchitis. I have also heard from medical practitioners saying this season is esp. bad for bronchitis. We will not have data about what is presently happening for at least months or maybe a year. Even then, I must question the accuracy of data in the US. Knowing that the vaccine depresses/suppresses immunity, if there is an action involving the lungs, might this be a factor in widespread bronchitis?

I am grateful I am much of a recluse and that most, if not all, of my friends never got jabby. When I work with others, it is often outdoors. However, I do make occasional trips into town. The more research that comes out, the less I feel like socializing. Considering the nearly epidemic level of bronchitis in our area, I will relate a recent experience. The onset of symptoms was sudden. I had often experienced bronchitis when I was younger during many years of poor health. However, the symptoms in this case were unlike anything I had previously experience. My first thought was to question whether it was some kind of new lab-created virus.

I immediately started remedies, within hours of the onset of relentless coughing, aches/pains, fever and chest pain that seemed to be more outside the lungs. (If someone can explain how that is possible with bronchitis and severe coughing, I think the explanation would be greatly enlightening about the process occurring.) For the benefit of all, I will share my protocol that led to all my symptoms disappearing within 2 hours. I boosted D3, K2, Mg. I initiated elderberry. I have found that Gan Mao Ling is effective in such cases, but only if started immediately during the onset of symptoms. These are remedies you may want to stock in your medicinary.

Posted On 02/03/2024

Bunny3

I think what you're saying is true. I haven't had anything like a flu in years and haven't been vaxxed. Almost four weeks ago I got a really bad cold. I was so congested I couldn't breathe at all thru my nose and I was very congested in the chest area. I was constantly wheezing and coughing up what seemed to indicate a viral infection because it was brownish, like the color of old blood. I also had a very bad cough, which I am not over completely, and sore throat for a few days. I am rarely around crowds and I have good nutrition and supplementation. There was no reason why I would suddenly get sick, and it lasting for almost a month. My husband caught it despite my taking precautions and he is just getting over it too. There is certainly something out there, and people who are older or with chronic illness should be very careful.

Posted On 02/03/2024

rrealrose

Most likely this is people getting any one of 100 virus' circulating this time of year, especially if they have a suppressed immune systems. Winter sickness, not necessarily flu but can be, is what we are seeing on the East Coast.

I got shedding from a double waxed older person because he was extremely soft speaking, so I had to bend into his face to hear him...during the time I counselled him. I am sure about this as I had no other contact in the previous two weeks at all - and before that I only went to buy food in the shops nothing close contact. Within two days I was extremely sick with very high fever (my family is infamous for not getting fevers) - total weakness, flu like symptoms etc. I was sick for six weeks long as initially I had no medicine ...thank you Australia... I would not go to any doctor or hospital as they prohibited ivermectin and hydrochloriquine but in my age they would exterminate me.

I remembered a research where they cured patients with extremely high intravenous vit C. So, trying to copy that I took 4000 mg vit C/day -this was the quantity that I assumed my stomach could handle - until my horsewormer arrived - for which I was extremely grateful to God...when I got it. Otherwise, I don't think I would survived as I'm an oldie - I had just the vit C for 7 days as medication...and that was exactly the border on having vit C - as my stomach began to be very painful I have a leaning to get stomach ulcer also that was exactly when I got the ivermectin in the form of a horsewormer tube from the veterinary clinic.

With the vit C I also had a carefully set up system of: vit K2 180 mg in the morning - my Nebivolol for my tachycardia & high blood pressure -Glucosamine sulphate 1900 + Chondroitin 750 for osteoarthritis - Rosehip with grapeseed & biotin - Kelp for underworking thyroid - NAC - 600 mg Fish oil artificial 1200mg - C vit + manuka honey 2x 1000mg -Magnesium 400 mg/day - Vit D3 50 microgram - Zinc 30 mg - Quercetin 500 mg & Probiotics 50 billion. Everyday I took these in intervallums - when the ivermectin arrived that was the first to be taken. Altogether I had 14 different vits & supplements during each day.

Posted On 02/04/2024

Macskak

Continue.... two weeks later I was better - the fever and weakness left. After 1 tube of Ivermectin finished I was not sure to continue or not as here was NOBODY to ask advice from. But when I stopped, I immediately felt worse after a day, so I continued for another tube altogether was 8 weeks. Still, I take lots of the supplements because some says the spike protein stays in the body for up to 14 month but likely longer.

How strange. While reading this I recalled 'googling' spontaneous nosebleeds a few months ago as I had begun experiencing them suddenly (no prior history). I dismissed it due to having a long list of allergies, periodic sinus issues, intermittent issues with chemical/ noise/ light/ sound sensitivities & environmental exposure to a variety of things, including allergens. I work with a fairly small group, but we've been in a small trailer while repairs completed on our usual offices. Out of 4 people I interact with daily, the one I do so with the most is vaccinated & is also the frequent covid victim, having had it a few times post vax.

The rest of us had not contracted it despite working on site throughout the scandemic. Since we've been crammed into the temp location & out of our usual offices, I've experienced more minor illnesses plus the bizarre sudden nosebleeds for short time. At some point afterwards I tested positive for covid 5 to 7 days after my vaccinated coworker tested positive.

I have limited to no opportunity to go out in public - gas station pump, grocery pick up or post office are infrequent exceptions due to work 6 days/wk. While I was home with covid, I noticed that frequently I felt as if I were having an allergy attack. Swollen, itchy eyes & uncontrollable sneezing were notable (and seemed unusual as it was not spring & I was in my hepa filtered low allergen environment at home). I do believe I caught covid from the vaxed coworker due to only having been around coworkers, but now wonder about the strange nosebleeds & minor illnesses.

A pal who is in healthcare with direct patient access & also unvaxxed, tested positive about 7 days after I did. Had minimal contact before my illness & none during, with exception of my friend dropping pet dog off in yard or door (to avoid contact) for me to dog sit some while I was home. We suspect the dog or mine, could have transferred virus. Also, have female friend claim she can smell vax on her husband.

I'm curious about sexual transmission from a vaccinated man with a non vaccinated woman. Can shedding take place there as well? I have clients voice their concerns over this and I have no answer for them

Look up at the sky to see what is causing these issues. Now add in 5G, Wifi, poisoned water, and food, medicine. Lack of exercise, and sun. Then this is amazing how it really could be ANYONE writing this article: "A Note From Dr. Mercola About the Author A Midwestern Doctor (AMD) is a board-certified physician in the Midwest and a longtime reader of Mercola.com." There are reasons this idea is being pushed.

Check out this article on the creation of covid and the "vaccine" they made of give bats so they would not get the man made covid and how it would self spread so it would be easier to "vaccinate" the bats. "Munster's plan involved making the virus-vaccine transmit between the bats via aerosols. This made it a self-spreading vaccine, able (in theory) to reach all the bats without humans having to go and find all their caves and spray them." dailysceptic.org/2024/01/30/is-this-the-man-who-created-covid-19-in-fa..
