Nice article but the most important thing you can do is eat properly because none of the bacteria can survive without a food, just try to do a study without a Petri dish and get back to me...:) without a constant food source the can't even grow much less become resistant the problem is there are over 600 different bacteria that live in the mouth alone and some replicate in as little as 10 to 20 minutes so when you hold fermentable carbs or constantly eat fermentable carbs you become the Petri dish... Brushing flossing and water picking will reduce disease but a proper diet will flat out stop it...the plant paradox diet is the best I've found at preventing disease in the entire alimentary canal because it simply doesn't allow a build up of carbs anywhere in the body and when you dealing with an animal that can have babies in 10 to 20 minutes and they are everywhere that's pretty important ...:)

The following essential oils kill MRSA. FDA doesn't want you to know because then Big Pharma will lose money: Clove, Cinnamon, Melaleuca (Tea tree oil), Oregano, and Thyme. There are hundreds of studies that prove that these essential oils are more effective than antibiotics at killing MRSA and other infections. Clove has the highest ORAC value of any known substance on earth.

My high school athlete suffered with recurring MRSA for 3 years. This infection takes so much out of an extraordinarily fit teen that he can't follow a conversation, his brain kind of shuts down, and he doesn't even recall anything during the time he's been sick. I can see why people die quickly from this esp fr a person who lives alone and no one is aware of how ill the person is. I can't get the schools athletic director, coaches or PE teachers interested enough to require basic cleaning of gym equipment. I'll print this article and drop it off with each of them.

Also i have overcome staph skin infection twice - 1st time i put undiluted food grade hydrogen peroxide on it. Yes it burned my skin but it also burned the staph into oblivion. It was one small spot on my hand. Dr said take antibiotics. I said that does not make sense for one spot on my hand. 2nd time, it was one finger. That was pretty bad- whole finger was swollen up. Dr said take antibiotics or you run the risk it will get worse. I decided to take my chances and put high grade iodine on it and i also know someone who does radionics - using scalar energy to remotely send appropriate frequencies depending on ailment. I sent him a pic of my finger and said its staph, dont know if its MRSA staph but balance this out of me. Within 48 hrs it was looking better. And it totally healed. The iodine made the whole top layer of skin peel off after about a week of putting it on my finger and i had new taunt young looking skin underneath. At the time this 2nd staph infection happened, i had to make decision to get ripped off with obamacare or cut myself free and go without health ins. After this event, I knew that I could find/get healing for all but the most serious or er issues myself with the knowledge, supplies and tools i already had.

Here is another view about MRSA you might not read or hear in most other places. The bacteria are not evolving but have lost DNA. [answersingenesis.org/natural-selection/antibiotic-resistance/the-genes..](http://answersingenesis.org/natural-selection/antibiotic-resistance/the-genes..)
